

Meander-Shelf

The Meander-Shelf was created in the course of the project → 100% C...NC. The design aimed at developing a simple shelf that can be slotted together and thus assembled without problems nor tools, and at the same time be manufactured with as little trim waste as possible. The two vertical shelf bearers merge in such a way, that they can be cut out of one board in one go.

The shelves have slots that correspond to the designated vertical shelf bearers. The shelves are put in place and lock when pushed back. The better the fit of the joints, the better the stability of the shelf. The Meander-Shelf can be made out of various board materials.

Used wood joint
